Customer Documentation Overview

2026-08-29

netevd is a Netlink-first Linux network event daemon (Rust). It watches carrier, address, route, and manager state — then runs your scripts with rich context. It also maintains per-interface policy routing on multi-homed hosts and exposes REST + Prometheus on `:9090` / `:9091` .

You want to...	Open
Install and fire the first hook	Getting Started
Orient around hooks / CLI / API	Using the operator surfaces
Screen-by-screen / command guides	Page-by-page guides
Look up hooks and CLI	Complete page index
YAML, systemd, ports, security	Admin basics
Multi-home, resume, observe	Common workflows

Printable PDFs

```
node scripts/customer-docs/build-customer-pdfs.mjs
```

Output lands in `pdf/` :

- `netevd-Customer-README.pdf`
- `netevd-Getting-Started.pdf`
- `netevd-Page-by-Page.pdf`
- `netevd-Admin-Basics.pdf`

Product at a glance

Hooks → /etc/netevd/{carrier,routable,routes,...}.d

Config → /etc/netevd/netevd.yaml

REST/API → :9090 (default bind 127.0.0.1)

Metrics → :9091

Unit → netevd.service

CLI → netevd status | list | show | events | validate | reload

Operate from CLI

1. Install and enable: `sudo ./install.sh && sudo systemctl enable --now netevd`
2. Validate config: `netevd validate`
3. Inspect live state: `netevd status && netevd list interfaces`
4. Watch events during a link test: `netevd events -f -i eth0`
5. Fleet scrape: point Prometheus at `http://<host>:9091/metrics`

Never publish lab IPs in runbooks — use `<host>` for remote targets.
